

StratPacks

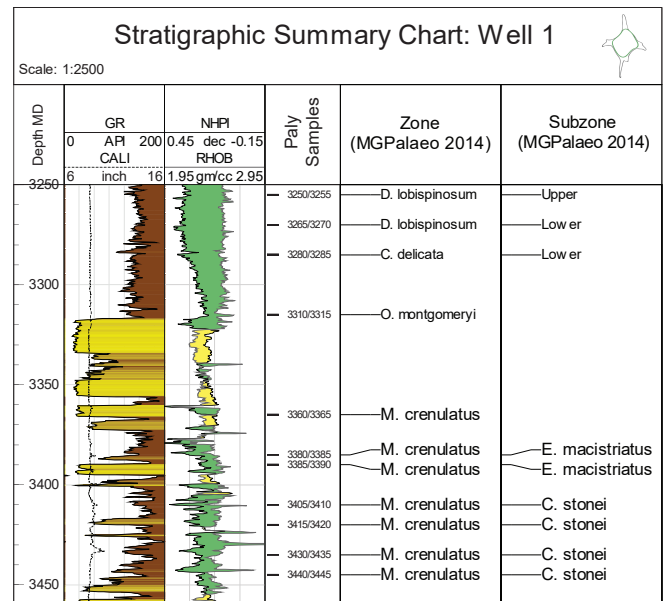

Stratigraphic Data Packages

StratPacks are designed to give an easy overview of existing biostratigraphic data available in an area.

StratPacks include:

- Palynological Summary Sheets (excel format) that contain a sample-by-sample listing of the palynological zones and inferred environments.
- Stratigraphic Summary Charts (right) for each well including age, palynological zones and sample points, all set against wireline log data.
- Multi-well Correlation Panels (below) that provide a clear picture of the stratigraphy in an area.

All data can be easily extracted into tabulated spreadsheets for input into your own database.

If you have specific areas of interest, please contact us to discuss creating a customizable StratPack that meets your requirements.
